

SECUR-T

Quick Change Propane Valve

- Fits on any forklift
- Fits on any steel propane tank
- Offers quick and easy installation
- Is more compact and has fewer parts
- Uses the factory coupler that comes standard on the truck, requiring less installation

The Problem: LPG escaping while changing forklift cylinders

Changing an LPG cylinder can sometimes give a forklift operator a big surprise! The seal in the cylinder valve can fail causing liquid propane gas to spray over the hand or face faster than they can react. Liquid propane vaporizes quickly (-420 C or -440 F) and will cause extreme frostbite if it touches skin.

The Solution: Placing a shut-off valve on the hose to prevent the LPG coming back onto the operator
